EXPERIMENT - 14

Brute Force Attack Study in Kali Linux

Step 1: Start Environment

Open Oracle VirtualBox and start Kali Linux.

Step 2: Setup Test Environment

Use a local test account with dummy credentials in an isolated environment.

Step 3: Study Attack Concept

Understand how repeated login attempts are used to guess passwords.

Step 4: Simulated Demonstration

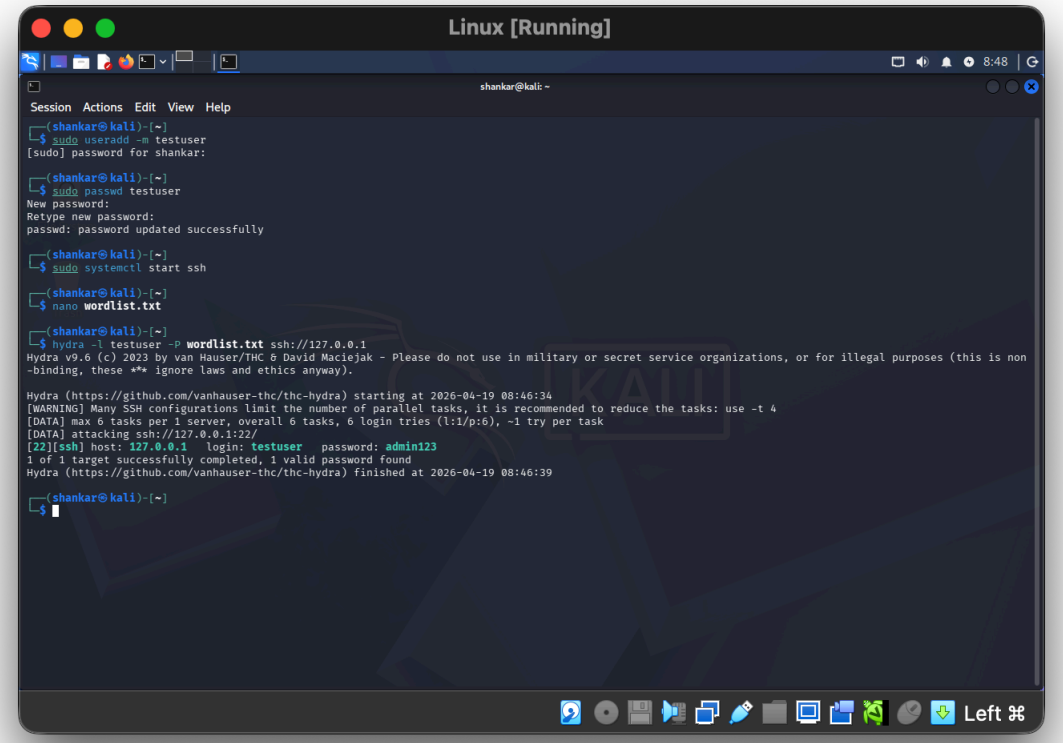
Observe multiple authentication attempts and system responses in a controlled setup.

Step 5: Analyze Risks and Prevention

Identify risks of weak passwords and study prevention methods like strong passwords, account lockout, and multi-factor authentication.

Output

Simulated login attempts demonstrate how weak passwords can be guessed.



Result

Brute force attack concepts were successfully studied, highlighting the importance of strong authentication mechanisms.
